Silencer II DTMF Mute

Optional single or dual rack mount available

The Silencer II provides an inexpensive and convenient method for using DTMF remote-control tones on an audio path without hearing them!

The Silencer II features include

- High impedance, balanced, bridging input accepts a wide range of input levels
- Active, balanced audio output easily drives 600 Ohm loads
- Unusually wide frequency response of 7.5kHz makes the Silencer II useful for satellite and RPU work as well as telephone & paging system muting.
- All ICs socketed
- Power supply included
- High quality metal enclosure with optional single or dual rack mount.
- Two year limited warranty.

Like the original CircuitWerkes Silencer™, the Silencer II™ takes its audio feed directly from your satellite receiver, phone system or other source. Its adjustable, balanced, audio output feeds program audio to your console, switcher or paging system input. All audio is delayed by 60ms (or about 1/20th of a second). The control tones are automatically muted from the audio path before they can exit from the delay. The Silencer II uses new technology to deliver a clean 7.5kHz bandwidth which has been impossible until now.

The Silencer II's enclosure is all metal and is desk or wall mountable. An optional rack mount adaptor kit allows it to be mounted in standard 19" racks.
